Sample Shop Product Manual

Sample document for the MCP PDF Content Finder project.

Page 1

Product Catalog

The catalog contains laptops, keyboards, mice, and accessories. Each product has a name, price, inventory quantity, and availability status.

Inventory

Before checkout, the application checks whether the requested quantity is available. A product with insufficient stock cannot proceed to order confirmation.

Pricing

The base total is calculated by multiplying unit price by quantity. Promotional discounts may then reduce the total. A discount percentage must be between zero and one hundred.

Checkout

Checkout validates inventory, calculates the total, applies the configured discount, and returns the final amount. Payment processing would normally follow this calculation.

Troubleshooting

If checkout reports insufficient inventory, verify the product name and requested quantity. If a price appears incorrect, review the configured discount and the product unit price.

Example

For two items priced at 100 dollars each, the base total is 200 dollars. With a 10 percent discount, the final total is 180 dollars.
